

a: Sustained attention

b: Switching attention

c: Conversation

Figure 1: Experiment paradigm and condition designs. Top panels (a), (b), and (c) show the experimental setup of SustAC, SwitAC and ConvAC, respectively. The setups for SustAC (a) and SwitAC (b) are identical, with attention directed to one out of the two frontal AV speakers. In (c), attention is directed either to the two frontal AV speakers engaged in conversation or to the side single speaker. Below each setup, the instructed attentional focus over the course of a trial is shown: attention is sustained on a single talker for SustAC and ConvAC, whereas SwitAC includes two switches between speakers.
